

BloomR time functions

R topics documented:

Misc functions
Beta misc functions
Time extension functions

Misc functions

Description

`rm.all` deletes all objects (variables and functions) from memory, including invisible objects (those starting with a dot). `rm.var` deletes non-function objects from memory.

Usage

```
rm.all()  
rm.var()
```

Beta misc functions

Description

Miscellaneous functions dealing with dates.

Usage

```
br.try.date(d)  
br.is.same.class(...)
```

Arguments

`d` a POSIXlt, POSIXct, Date, “%Y/%m/%d”, or “%Y-%m-%d” vector

Details

`br.try.date` converts a vector to a date vector if possible or return NULL. Any vector element should be POSIXlt, POSIXct, Date, “%Y/%m/%d”, or “%Y-%m-%d”

`br.is.same.class` check if all supplied arguments have the same class. It is mostly intended to check if dates are homogeneous.

Time extension functions

Description

Functions to get, set dates.

Usage

```
day(d)  
month(d)  
year(d)  
day(d, n)
```

```
month(d, n)
year(d, n)
day(d)=x
month(d)=x
year(d)=x
d +% n
d %-% n
last.day(d)
day.us(d1, d2)
```

Arguments

d, d1, d2 objects of class date
x an integer representing the day/month/year
n an integer representing the months to add/subtract

Details

If **component** is **day**, **month** or **year**: **component(d)** returns the *component* of the date **d** as an integer; **component(d, n)** returns the date **d** with the *component* set to the integer **n**; **component(d)= n** sets to the *component* of the date **d** to the integer **n**.

+% and **%-%** add and subtract months to a date.

last.day returns last day of the month as an integer. **day.us** calculates date differences with the US convention.
